

XS DIVERTER HEAD (PNEUMATIC)

QUICK AND EFFORTLESS HANDLING

This revolutionary pneumatic fixed diverter concept is fast and effortless, reducing casing handling time, resulting in increased productivity

The diverter is attached to the rotation head with two air cylinders and is operated by a pneumatic remote-control valve situated on the control panel. The operator can raise or lower the diverter to expose the top of the drill tube or add down pressure to the casing if necessary. The lower portion of the diverter will revolve on its bearing along with the casing, should the casing turn.

**Easy and safe to
operate**

Durable seals

**Adaptable to several
casing sizes**
