

XS GTE3 SYSTEM

The GTE3 system is undoubtedly the most popular model in our wide range of drilling systems. Primarily used for pile drilling, this system stands out due to three key advantages that places us ahead of the competition :

1

Drilling the casing with the same driver bit :

This feature ensures consistent performance and high efficiency while reducing the need for additional equipment.

2

Ease of switching between the two modes :

The GTE3 offers simplified handling, allowing the operator to easily switch between modes, optimizing intervention time.

3

Drilling large diameters in rock :

Thanks to its design, the GTE3 enables drilling in rock with a diameter identical to the inner diameter of the casing.

These features make the GTE3 an indispensable choice for those seeking a reliable, high-performance system adaptable to a variety of drilling conditions.
